

**Retrieval of data (Simple select query and select with where options
(include all relational and logical operators))**

- List details of all employees.
- List employee number, employee name, date of birth, and salary for all employees who make more than 30,000 a month. Sequence the results in descending order by salary.
- List name and the department number for all employees. The listing should be ordered by descending department numbers. Within the same department, the employee names should be sorted in descending order.
- List the different education levels in the company in descending order. List only one occurrence of duplicate result rows.
- List employees, by employee number, and their assigned projects, by project number. Display only those employees with an employee number less than or equal to E0100. Sort the result rows by employee number.
- List employee name, salary, and bonus of all male employees.
- List employee name, salary, and commission for all employees with a salary greater than 20,000 and hired after 2004.
- List employee name, salary, bonus, and commission for all employees with a salary greater than 22,000 and a bonus of 400, or for all employees with a bonus of 500 and a commission lower than 1,900. The list should be ordered by employee name.
- List employee name, salary, bonus, and commission for all employees with a salary greater than 22,000, a bonus of 400 or 500, and a commission less than 1,900. The list should be ordered by employee name.
- Using the EMP_PROJ table, for all projects that have a project number beginning with AD , list the following:

Project number Employee No Employee Time

Order the list by employee time within project number.

- List manager number and department number for all departments to which a manager has been assigned. The list should be ordered by manager number.
- List employee number, name, salary, and bonus for all employees that have a bonus ranging from 800 to 1,000. Sort the report by employee number within bonus, lowest bonus first.
- List employee number, name, salary, and department number for all employees in departments A00 through C01 (inclusive). Order the results alphabetically by employee name and employee number.
- List all projects that have SUPPORT as part of the project name. Order the results by project number.
- List all departments that have a 1 as the middle character in the department number. Order the results by department number.
- List the names and salary of the five highest paid employees.
- List the names and salary of the five highest paid non-manager, non-president employee.

Data manipulations using date functions

- Provide a list of all projects which ended on January 2, 2014. Display the year and month of the starting date and the project number. Sort the result by project number. Name the derived columns YEAR and MONTH.
- List the number of months between start date and end date of each project.
- List the HireDate in the format 'DD-Month-YY'.
- List the date , 15 days after today's date.
- List all the employees who joined in the month of June.
- Illustrate the different date functions using dual table (to_date, Add_months, last_day, months_between, next_day, round etc.)
- Illustration of special date formats using to_char function (use of th,sp,spth)
- List all employees who were younger than 25 when they joined the company. List their employee number, employee name, and age when they joined the company. Name the derived column AGE. Sort the result by age and then by employee number
